Rainbows

A rainbow spans a continuous spectrum of colours there are no "bands". The apparent discreteness is an artefact

of the Noun - Plural in the human eye and of the neural processing of our Adjective

Noun - Plural in the brain. Because the peak response of human colour receptors varies from

Animal to **Repeat Last Animal**, different individuals will see slightly different colours, and persons with

Adjective Noun - Plural will see a smaller set of colours. However, the seven colours listed below

are thought to be representative of how humans everywhere, with normal colour vision, see the rainbow.

Full Name of a Person originally named only five primary colours: Color, yellow, green,

Color and violet.

Later he included orange and Color, giving seven colours by analogy to the number of Noun -

Plural in a Adjective Noun.

The colours visible in the rainbow are not pure spectral colours. There is spectral smearing due to the fact that

for any particular wavelength, there is a distribution of Adjective Noun - Plural, rather than a single

unvarying **Repeat Last Noun - Plural**.
