How to Solve an Inequality

1. Verb _____

2. Number _____

3. Verb _____

4. Number _____

5. Letter _____

6. Verb _____

7. Letter _____

8. Adjective _____

9. Letter _____

10. Number _____

How to Solve an Inequality

To solve an inequality you must first isolate the radical. Once you isolate the radical you have to get rid of the radical. To get rid of the radical you have to _____Verb_____ the number(s) on the other side of the equation to the same power that the radical is. For example, if your radical is the _____Number_____ root than you _____Verb_____ the other side of the inequality by _____Number_____. Once you get rid of the radical then you'll have an inequality with an "_____Letter_____" in it. You then have to _____Verb_____ for "_____Letter_____". The most important thing to remember is that the numbers under the radical cannot be _____Adjective_____. That means that "_____Letter_____ " has to be greater than _____Number_____.
