Recent anti-vaccine movement have caused many patient's to not be vaccinated; such resulted in rise of near-eradicated diseases as Noun. Anti-vaccine movement presents Noun evidence that can either be disproven or have no credible evidence. At the front of their reasoning, Andrew Wakefield and his MMR vaccine research stands. His research states that Noun vaccines can lead to autism shortly after administration; however his study was considered to be Adjective and he was reportedly paid to do produce such data. Another argument brought on by anti-vaccine movement is the use of thiomersal as a Noun. It contains mercury which act as a Noun in free metal form. However, when mercury is incorporated into a chemical structure, it loses its toxicity. To prove this point even farther, no health organizations have yet to find a Noun between vaccine and thiomersal as its concentration decreased greatly in recent years while autism patients increased drastically. Additional points brought on to the debate is mythical concept of vaccine overload. It refers Noun system of infants/youngsters' being overwhelmed by sheer number of vaccines they receive. Some believe the rigorous activation of immune system results in Noun symptoms. To disprove such theory, antigen concentration within a vaccine is subsequently smaller than the amount of pathogens encountered by a single Noun. Also, concentration of antigen within the past 3 decade decreased by 90% while number of autism cases increased greatly within equal time.
