Triangles

Cross sections are when you cut the shape in half any way. The _____shape_____ serums are the two shortest

lengths are longer than the longest length. The other triangle serum is all three angles add up to _____number_____.

The four angle relationships are _____type of angle relationship_____ which is when you do _____number_____ minus the

given number and it will give you the missing number. _____type of angle relationship_____ is when you do

_____number_____ minus the given number. _____type of angle relationship_____ is when you find the other angle that adds

up to _____number_____. The way you figure out _____type of angle relationship_____ is the two angles have the same side

and vertex. The way you find the sum of the interior of a _____shape_____ is you see how many sides there are and

subtract 2 from it. Then you divide 180 by that number. A _____type of angle_____ triangle is a triangle that doesn't

meet either of the serums. A _____type of angle_____ triangle is a triangle that you can't make more than one triangle

out of the three measurements. An _____type of angle_____ triangle is a _____shape_____ you can make more than one

_____shape_____ out of it. Similar triangles are triangles that are congruent and similar.
