Different parts of the have different climates. Some parts of the world are hot Conjunction	
rainy nearly every day. They have a tropical wet climate. Others are cold and snow-covered most of the year	r.
They have a polar climate. Between the icy poles the sa noun are ma	any
other climates that contribute to Earth's biodiversity and geologic heritage.	
Climate is determined by a region's system. A climate system has five major components: th	e
atmosphere, the hydrosphere, the cryosphere, the land surface, and the biosphere.	
The atmosphere is the most variable part of the climate system. The composition and movement of gases surrounding the Earth can change radically, influenced by natural and man-made factors.	
Changes to the, which include variations in temperature and salinity, a much slower rates than changes to the atmosphere.	it
The cryosphere is another consistent part of the climate Ice sheets and glaciers sunlight, and the thermal conductivity of ice and permafrost profoundly influences	
temperature. The cryosphere also helps regulate circulation. This "ocean belt"	has
an influence on marine ecosystems and biodiversity.
