All Drains Lead to the Ocean

Local news report transcript.

News Anchor: Now to our next story. A young man is on the road to recovery after a close shave on a holiday retreat, which left him hospitalised. _____Name you would give to your cat_____ _____Type of fish_____ reports.

Reporter: At a suburban home on the outskirts of _____Country_____, _____Male celebrity_____ was just your average _____Profession - eg doctor or farmer_____. With the holiday season approaching, he, like many others, had planned a trip away from his home town. Little did he know, a short holiday, would change his life forever.

Interviewee: I just thought..... _____A curse word a first-grader would use_____ ..... when they came back with the diagnosis ."

Reporter: _____Female name_____ , _____REPEAT male first name_____ 's long-term partner of _____Number_____ months, tells reporters they had only been looking for a change of scene. After years without a break, _____REPEAT male first name_____ and _____REPEAT female name_____ decided to apply for work leave, and, together with their pet _____Animal_____,

embark on a much-needed road trip. A few days in, however, things took a turn for the worst.

Interviewee: "We were ordering _____Adjective you would use to describe a car_____ _____Country_____ salads from _____Restaurant chain_____ , and that was when his symptoms first started. _____Verb ending in ING_____ , _____Verb ending in ING_____ . He couldn't stop himself. Yeah, it was strange, but we thought, you know, maybe he would sleep it off. So that night we just went to bed and both tried to ignore it."

Reporter: The next day, they found their troubles, far from over.

Interviewee: "Morning came, and I looked over, and we couldn't hold a conversation, the _____REPEAT verb ending in ING_____ was so bad. That was when we grabbed our _____Plural objects_____ and rushed to hospital."

Reporter: It's hard to imagine just how difficult it must be to see a loved one in such a state. _____REPEAT male first name_____ was also suffering from excessive _____Verb ending in ING_____ fits, as well as intrusive thoughts about _____Plural objects_____ . Nurses struggled to diagnose these symptoms, but eventually, doctors declared he had contracted a non-lethal bacterial disease. When they asked whether he had been in contact with any wildlife the day before, the couple admitted they had been attacked by a swarm of _____Plural cute animals_____ during their evening _____Landscape - eg beach or mountain_____ walk. Doctors prescribed a course of antibiotics, and strongly advised him to return home immediately. The couple boarded a _____Vehicle of transport_____ , and arrived home the next day.

Interviewee: "They estimated the recovery would take two weeks."

Reporter: While the medication, at first, seemed to be working, that relief was short-lived. Just a few days later, it was clear something was still very wrong. The original symptoms began returning, and after just one week, _____REPEAT male first name_____ was exhibiting an extensive, new symptom: an affinity towards _____Plural_____ _____something you would buy on eBay_____ . More worried than ever, they paid yet another visit to hospital.

Interviewee: "I showed them which antibiotics he was taking, and..... they were all sort of at a loss."

Reporter: Nurses assured the couple that the latest symptom was simply a side-effect of the medication. They accused _____REPEAT female name_____ for improper administration of the antibiotic, saying she had failed to correctly administer the daily dose via the _____Body part_____ , which was why the symptoms had resurfaced. She insisted this was impossible, and the team of doctors were forced to inspect the patient more closely. What they found, was astounding. _____REPEAT male first name_____ had contracted a well-documented pathogenic bacteria, known as spp. _____Two words that rhyme_____ -us. While cases of human infection tend to be rare, the bacteria are ordinarily treatable with a regular course of antibiotics. However, on this occasion the bacteria proved unusually resistant to antibiotics, despite looking identical to the classic bacteria in every way. Pharmaceutical teams immediately began research into a new class of antibiotics, to treat _____REPEAT male first name_____ 's troubling condition.

Medical professional: "It's normal for bacteria to be slightly resistant to antibiotics. But what is not normal, is finding high levels of immunity in the wild. We used to only see that in densely-populated areas like hospitals and _____Plural place you would go for fun - eg parks or nightclubs_____ ."

Reporter: Employees at the Centre for Infectious Research at the University of _____Brand of beer_____ , are already investigating this emerging issue of antimicrobial and antibiotic resistance. Head of department, Dr. _____Letter of the alphabet_____ _____Item of clothing_____ , who holds the world record for most _____Adjective_____ _____Plural nouns_____ _____Past tense something you hate doing - eg vacuumed_____ , claims we are now facing a _____Number_____ percent increase in the risk of infection by resistant diseases.

Medical professional: "No matter who or where you are in the world, this concerns us all. The antibiotics we feed to our livestock for the meat and dairy industries, and those which we consume ourselves, most of it ends up in the ocean. And what happened in the case of this gentleman is, these _____REPEAT cute animals_____ were exposed to abnormally high levels of antibiotics, which caused them to be host to resistant bacterial strains. Of course, we know they spend most of their time hunting _____Adjective you would use to describe an eel_____ _____Plural marine organisms_____ ."

Reporter: Bacteria have the ability to exchange genes with their environment, and each other. Thus resistance, once encouraged by antibiotics, is a self-feeding loop. As more and more antibiotics are entering our oceans, resistance

can quickly emerge in places as remote as _____Somewhere you would teleport to in the event of an apocalypse_____ . Even more _____Word you would use to describe a horror movie ending in ING_____ , not only does this breed immunity in the wild, but it also increases the severity of any given disease.

Medical expert: "Times are changing. We are not living in the _____Historic event_____ anymore. We need to take action, stop developing so many new antibiotics to combat the problem, and, instead, start using these medicines more responsibly. If medications like this were more strictly regulated, and patients more closely monitored, we wouldn't have this crisis on our _____Plural body parts_____ ."

Reporter: _____REPEAT female name_____ says she is just grateful to have solved this mystery, and glad that life will soon be returning to normal.

Interviewee: "They've made new antibiotics for him now. He's still in hospital at the moment, but it's been a week, and his symptoms have subsided a lot. So he should hopefully be back to his _____Adjective_____ old self in no time."

Reporter: At this moment we are pleased to report that _____REPEAT male name_____ is in a stable condition and is expected to make a full recovery.

News

Anchor: _____What you would say if you found out you got an A plus on your chemistry test_____ !!!!! Thanks _____REPEAT_____

_____name of cat_____ for that report. Our thoughts and prayers are with them for a speedy recovery.
