The Biology of Turtles

Even though many spend large amounts of their lives verb ending in ing all turtles and tortoises are
air-breathing reptiles, and must surface at regular intervals to refill theirwith fresh
Noun. They can also spend a lot of their lives on dry land. Aquatic respiration in Australian freshwater
turtles is currently being studied. Some species have largecavities that are lined with many
finger-like projections. These projections, called 'papillae', have a richsupply, and serve to
increase the surface area of the cloaca. The turtles can take up dissolved oxygen from the water using these
papillae, in much the same way that fish useto respire.
Turtles lay eggs, like other reptiles, which are slightly soft and The eggs of the largest species
are spherical, while the eggs of the rest are Their albumen is white and contains a different
protein than do Noun eggs, such that it will not coagulate when Past tense verb. Turtle eggs
prepared to eat consist mainly of In some species, temperature determines whether an egg
develops into a male or a Noun: a higher temperature causes a Noun a lower temperature
causes a male. Large numbers of eggs are deposited in holes dug into mud or sand. They are then covered and
left to often by themselves. When the turtles hatch they squirm their way to the surface, where
some species will find their mother who helps to <u>Verb</u> the <u>Noun</u> .
